

What we can build, and what needs a decision

Every item in the site architecture map, sorted by whether this app can deliver it. Checked against the canonical Listing type, the section and query layer, the migration schema, the agent directory policy, and the Reapit sandbox probes — not against the live site.

Live in the app	Fits the model	Needs a decision	Webflow CMS	Out of scope

Live in the app

Server-rendered from D1 today. The map describes these accurately and nothing about them needs revisiting.

Buy	/buy	header · fig 01, 02	Carries <code>forSale</code> and <code>underOffer</code> together, which matches the map's read that under-offer is a status rather than a view. A property that goes under offer keeps the URL that earned its ranking.
Rent	/rent	header · fig 01, 02	Residential rentals. The commercial split the map shows underneath it is the one piece not yet wired — see the next section.
Sold	/sold	header · footer	Reached from the Sell dropdown in the header and the Properties group in the footer. One page, both entry points.
Leased	/leased	fig 02, 03	Appears in the content model and in the office microsite nav but has no corporate header entry. Built either way.
All properties	/properties	not in the map	An addition, not something the live site has. It is where a bare entry point lands and where the legacy <code>/listings</code> URLs redirect to.
Property record	/property/<slug>	fig 02 hub	The hub the map is built around. One record, surfaced through every section — correct. The URL format is a separate problem and sits in the decisions section.

Our offices — and Contact `/offices`

header x2 · footer

The map's observation that Contact has no page of its own and resolves to the offices directory is right, and the app already follows it.

Office page `/offices/<slug>`

fig 02, 03

Already renders that office's team and a page of its listings, so "Our office" and "Meet the team" from the microsite nav are partly covered.

Our agents / Our people / Find an agent `/agents`

header x2 · footer

Three labels in the map, one index page. **Who appears on it** is an open question — see the decisions section.

Agent page `/agents/<slug>`

fig 02

Flat, not nested under the office as the live site has it. Deliberate — an agent changing office shouldn't change their URL — but it makes the redirect map harder.

Property search panel `PropertySearch`

implied by Buy / Rent

Exported as a Webflow code component, so the same filter can sit on a Designer-built Buy or Rent page and submit into the app. Plain GET form, nothing to hydrate.

Fits the model, not built yet

Nothing here needs a decision from Stone. The data supports it and the type doesn't change — it is work, not risk.

Buy → Residential / Commercial

header · fig 01

`category` is already a column in the migration and already on the canonical type, but it isn't a filter in `SearchParams` yet. A small query-layer addition, then two routes.

Rent → Commercial

header · fig 01

The same addition as above, scoped to `forRent`. Both land together or neither does.

Office-scoped Buy / Rent / Sold / Leased

fig 03 microsites

The largest unestimated item in the map. The search function already takes an `officeId`, so the capability exists — but fig 03 implies 76 offices × 4 sections, plus a scoped nav that has to stay in step with the corporate one. Roughly 300 pages nobody has costed.

Listings by agent

fig 02 agent tier

Search already accepts an `agentId` through the listing-agent join, so an agent page can show what they front. Not yet on the page.

"Just listed" badge

fig 02 status list

The map files this as a status. It is a recency rule over `listedAt` applied to a for-sale listing — a display decision, and cheap. Keeping it out of the status field is what makes it cheap.

Needs a decision before it can be built

Each of these changes the canonical type, the schema, or what gets published about a real vendor or a real person. They are questions for Stone, not engineering choices.

Off market sales

header · footer · fig 02

The map treats it as a fifth public view of the same record, with *Pre-market opportunity* as its status. There is no such value in the type and none in the public status set. Two questions, in order: **have vendors agreed to an off-market listing sitting on a crawlable page**, and if so is it a new status or a visibility flag? The first is the same consent question that keeps withdrawn listings off every public URL.

Legacy property URL format

fig 02 · prose

The most urgent item here. The map gives two shapes for the same page — `/property/{id}-{address}-{suburb}/` in the prose, `/property/{id}/` in the diagram. The only redirect handler in the app covers `/listings/*`, which is our own earlier path space, not WordPress's. If the live shape is the long one, nothing currently redirects roughly 5,200 indexed pages.

Who appears in the agent directory

fig 02 agent tier

The map assumes every agent has a page. In the sandbox there are 108 staff, 98 of them with an Admin role, and 47 front a live listing — including accounts named "Atomix Sandbox" and "Birdeye Test". The publication rule currently passes 12. Someone at Stone needs to confirm that rule against production before 837 agent pages get generated.

Agent URL nesting

fig 02 · fig 03

The live site nests an agent inside their office. Ours is flat. Preserving the old URLs means a 301 map keyed on each agent's **historic** office assignment — data the feed may not carry. Worth confirming what we actually have before promising the redirects.

Acreage as a Buy facet

header · fig 01

Listed as a sibling of Residential and Commercial, but it sits on a different axis. Those two are categories; Acreage is a property type, alongside Farm and Lifestyle. So this one nav item is `propertyType=Acreage`, or `category=rural`, or a set of types — three different result sets. Someone has to pick.

New projects

header · fig 01

In the header under Buy, absent from the content model in fig 02. Developments are normally a parent record with child unit listings, and the schema has no project entity and no parent-child relation. Either it is a filter — and we need to know which — or it is a content type nobody has scoped.

Opening Times calendar

fig 02 prose

The map says the homepage calendar reads the same records. Inspection and open-home times are **not on the canonical type at all** — there is no field for them and no table. A real schema addition, easy to miss because the map mentions it in passing.

Aligned, but Webflow CMS rather than this app

Marketing and policy content with no listing data behind it. Correct that they exist, correct that they sit in the nav — they just aren't built here, and shouldn't be.

ITEM

NOTE

Selling with Stone	3 labels, 1 page
Leasing with Stone	+ approach to management
Manage	property management
About us	header · footer
Join us	resolves to /careers/
Franchise	footer only
Business agent	header only
Blog	footer only
Your questions our answers	footer only
Privacy policy	legal
Terms and conditions	legal

The map's duplicate-label findings all live in this group and all hold up: *Selling with Stone* in the header is the same page as *Our approach to selling* in the footer, which makes three labels for one URL. Worth resolving in the CMS before launch, but it costs nothing here.

Out of scope for this project

Named as out of scope, or dependent on a system that does not exist yet. Each still needs somewhere to point on launch day — leaving them on the old site is a legitimate answer.

Property alerts

header x2 · footer

Explicitly out of scope. It also needs three things this project has none of: accounts, a saved-search store and outbound email. The map notes all three links appear to resolve to one page, which makes the launch-day decision simpler.

Request appraisal

header x2 · fig 03

A lead form that has to write back into Agentbox. Nothing in this project writes to Agentbox in any direction — the integration is read-only, and against the sandbox only.

Property report

header, top level

The one standalone conversion item in the header, and the map is right that it has no children. It is a third-party valuation tool, not listing data.

The SHEDD

footer · external

Leaves the domain for a LightSpeed VT training platform. A link, correctly flagged in the map as off-site.

What still needs someone else

1. **Off market** — whether vendors consented to public off-market pages.
2. **The legacy property URL format** — which of the two shapes the live site uses.
3. **The Opening Times calendar** — whether inspection times are in scope, since they need a schema addition.

Verified against: the canonical Listing type, the section and query layer, the migration schema, the agent directory policy, and the Reapit sandbox probes.

Not verified against the live site — figures 02 and 03 of the source map are inferred from URL structure, as its own footer notes.
